625T Introduction

Overview

The 625T is the newest edition to the line of Cybex treadmills. This new commercial workhorse treadmill has been designed off the same platform as the recently introduced 770T-CT, and shares many common mechanical components such as motor, drive, rollers, elevation system, frame, and uprights. The AC motor and drive in the 770T/625T are the same proven technology as the 750T. The 625T is equipped with our IS³ suspension system to precisely match the body mechanics of running.

The split-level display design keeps workout profile & metrics at the user's eye level on the upper display while the lower section has a membrane with high contrast color buttons in a centralized area close to the user natural hand position with speed and incline controls at their thumbs.

Entertainment

The 625T will be available with either an 900 or 800 MHz embedded wireless audio receiver that uses the channel and volume buttons to control the audio source. The treadmill must be ordered with this option as it is configured at the factory and not available as a retrofit piece. Please refer

to the Wireless Audio Receiver Product Information for more technical product information and contact information for your local distributor of transmitters. Please take note that the 625T will not have a PEM option.

Availability

Production of the 625T is schedule to begin on February 21st. The 900 MHz embedded receiver option will be available as of March 7th, while the 800 MHz version will be available early April.
